

DESIGNER SERIES WALL MOUNTED DISPENSERS

vs. The Competition

- | | |
|---|---|
| <ul style="list-style-type: none"> ■ Proprietary Top Dispensing Technology
- user sees soap being dispensed, meaning fewer pushes and less soap wasted ■ No Leak Guarantee
- due to top valve placement ■ Dispenses Foam and Liquid Soaps, and Foam and Gel Hand Sanitizers ■ ADA Push Compliant, ADA 4" Wall Protrusion Option Available ■ Large View Window with Customizable Product Identification Window Card ■ Available in Black, Gray, White/Gray, Black/Chrome, All White, Multi-color ■ Reduced Packaging
- uses 50% less plastic than hard cartridges ■ Pump Spring Will Not Wear Out
- it is in the refill, not the dispenser | <ul style="list-style-type: none"> ■ Bottom Dispensing
- user unable to see soap being dispensed, meaning extra pushes and more soap wasted ■ More leaks due to bottom valve placement ■ Soaps and sanitizers may require different dispensers ■ No Product Identification
- user does not know if product is hand soap, hand sanitizer, etc. ■ Cartridge Manipulation
- top of cartridge can be cut open to accept bulk fill product ■ Spring to dispense product is attached to the dispenser and will wear out over time |

FOAM SOAP VS. LIQUID SOAP BENEFITS

EASE OF USE:

Foam soap is much easier to use than Liquid soap.

- Dispensed Foam is thick and stays on your hands, while Liquid tends to run off your hands and down the drain.
- Foam is pre-lathered and ready to use, while Liquid takes time to lather up and work into your skin.

SOAP USED

PER 1000 HANDWASHINGS

SOAP SAVINGS:

Converting from Liquid to Foam reduces the amount of soap used per handwash.

- Most Liquid Bulk and Bag-In-Box systems dispense 1.5 mL of soap per handwash, while our Foam system only requires 0.75 mL or half the amount.
- The same size refill of Foam soap should provide twice as many handwashes or last twice as long!

WATER SAVINGS:

Converting from Liquid to Foam will also save gallons of water!

- Since Foam is pre-lathered and has lower viscosity, it reduces the lather up and rinse time per handwash by 5 seconds or more.
- An average faucet runs at 50 mL per second, saving 250 mL per handwash (5 seconds x 50 mL = 250 mL)
- You can save 66 gallons of water for every 1,000 handwashes! (1,000 x 250 mL = 250,000 mL / 3,785 mL per Gal = 66 Gallons)
